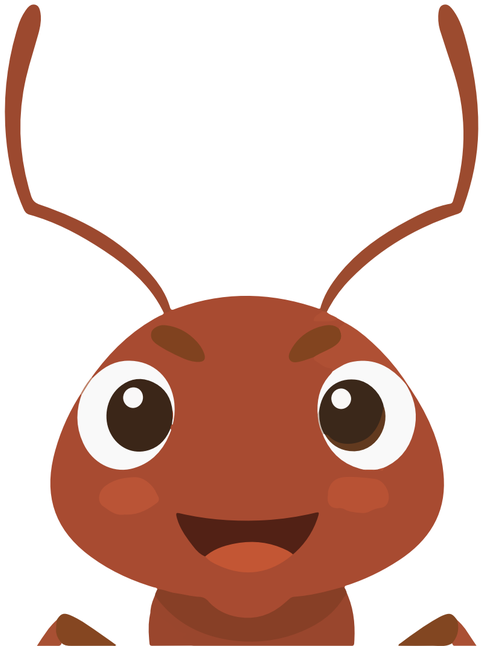
Introduction

This documentation presents “Anatomy of Minds - A comparison journey”, an interactive prototype exploring how brains variable in looks and work regarding intelligence, emotions and environtment across species through a comparison of different animals and human brains.

The project investigates three key dimensions: anatomy, environment, and emotions, using tangible interaction to make complex neuroscientific research accessible to museum visitors and students.


Developed by Cosima Bühler, María Jesús Fonsca, and Yannik Stegmaier in the course “Interactive Communication Systems”, the prototype combines physical computing with custom illustrations to visualize brain structures and cognitive abilities.
