Problem Statement & Goals (Topic)

Our primary objective was to educate audiences about the comparison of brains across different species.

During our research, we realized that this topic could be particularly **complex** due to the presence of **technical language** and **scientific data**.

For this reason, we set out to design an exhibition that would effectively communicate the subject while allowing users to learn without feeling overwhelmed.

In this way, we aimed to create an experience that could be understood by a **broad audience**, including **young children** as well as **adults**, regardless of their prior knowledge of the topic. This led us to define our design challenge: how might we create an interactive museum exhibition that enables visitors to learn about the similarities and differences between the brains of various species in an engaging, accessible, and non-overwhelming manner?
